Equations

Let
$$p(x) = \mathcal{N}(\mu_1, \sigma^2_1)$$
 and $q(x) = \mathcal{N}(\mu_2, \sigma^2_2)$:

$$\mathcal{N} = \frac{1}{\sigma \sqrt{2\pi}} \exp^{-\frac{(x-\mu)^2}{2\sigma^2}}$$

(1)

Kullback-Leibler divergence for continuous probabilities:

$$D(p,q) = \int p(x) \log \frac{p(x)}{q(x)} dx$$

$$= \int p(x) \ln p(x) dx - \int p(x) \ln q(x) dx$$

$$= \frac{1}{2} \ln \left(2\pi \sigma_2^2 \right) + \frac{\sigma_1^2 + (\mu_1 - \mu_2)^2}{2\sigma_2^2} - \frac{1}{2} \left(1 + \ln 2\pi \sigma_1^2 \right)$$

$$= \ln \frac{\sigma_2}{\sigma_1} + \frac{\sigma_1^2 + (\mu_1 - \mu_2)^2}{2\sigma_2^2} - \frac{1}{2}$$
